A Deliverable-1: Version Control Policy

Individual team members may use whatever Git management tools they wish to access, commit to the repository and to have an up dated backup files. Individual members are responsible for merging their changes to the repository correctly. All commits must include a summary and description.

One caveat of document and code submission is that unwanted files may accidently be included in a commit. For instance, .class files or MS Word document temporary files may end up being committed with the intended code or documentation. Git collaborators are expected to use .gitignore (A gitignore [1] file specifies intentionally untracked files that Git should ignore. Files already tracked by Git are not affected) or otherwise delete extraneous files before committing the intended content to the repository.

Any disputed content introduced to the repository must be brought up in either group, Slack (ust-seis-732) or in class.
